LAYTHAW command

The **LAYTHAW** command is used to frozen all layers in the drawing.

Command Access:

Ribbon : Home > Layer > LAYTHW
Menu : Format > Layer Tools >Thaw all layers
Command : LAYTHW

Command Prompts:

All layers have been thawed.
Regenerating model

Function Description:

All frozen layers could be thawed. Objects on thawed layer will be visible except layers turned off or frozen in all other layouts. For those frozen layers in other layouts, users should firstly thaw them in each layout one by one.
Note: users could thaw layers in viewport by the VPLAYER command rather than the LAYTHW command.
