

# Pan and Zoom

You can pan a view to reposition it in the drawing area or [zoom](#) it to change its magnification.

Using the Realtime option of the [PAN](#) function, you move your pointing device to pan dynamically. PAN does not change the scale or location of objects in your drawing; it only changes the view.

You can change the magnification of a view by zooming in and out. ZOOM does not change the absolute size of objects in the drawing.
